

Survey for summary assessment

Thank you for taking part in this study project. Your ideas are very helpful for us to understand how useful and effective the summaries are. For each trial, read the consent form (linked at the top of each section). Then, respond to the survey questions on each summary. Your answers will help us make them better.

Thanks for taking the time to help. Now let us begin.

* Indicates required question

1. What are your First and Last initials (only so we can track responses internally, these will not be released in a dataset) *

2. Are you a physician *

Mark only one oval.

☐ Yes

☐ No

In the upcoming section, you'll find two summaries for each clinical trial. Please take a moment to read the linked consent form and review each trial summary and respond to the questions accordingly. Thank you for your attention to this task.

Clinical Trial 1: Patterns and Prevalence of FDG Extravasation in PET/CT Scans (Lucerno device)

Summary 1

This research study, sponsored by Lucerno Dynamics, aims to understand how a special dye used in PET/CT scans spreads in the body and if any stays at the spot where it was injected. This is done using a non-invasive device with sensors that can detect the dye without any surgery or internal examination. If you join this study, it will add less than 5 minutes to your PET/CT scan time, which usually takes up to 2 hours. The sensors will be placed on your skin in four spots and will stay there while the dye circulates in your body. You might feel some discomfort from the sensor's sticky pads or lying still for the scan, and there's a small chance of an allergic reaction to the pads. Your private information will be kept safe. Joining this study won't directly benefit you, but it could help improve PET/CT scans for others in the future. Participation is completely your choice, and you can stop at any time without affecting your medical care or the results of your PET/CT scan. The only other option is not to participate.

Summary 2

This study, led by Dr. Medhat Osman at Saint Louis University, is researching how often and in what way a radioactive tracer used in PET/CT scans might leak out of the vein where it's injected. This leakage could affect the scan's accuracy. If you agree to join, the study will add less than 5 minutes to your scan time. You'll have small sensors placed on your skin in four spots to track how the tracer moves in your body. This will happen during the normal waiting time before your scan. There's a small chance you might feel discomfort from the sensors or have an allergic reaction to their adhesive, but the study team will be there to help. Your participation won't directly benefit you, but it could help improve PET/CT scans for others in the future. Joining is completely your choice, and you can stop at any time. If you decide not to join, it won't affect your medical care. Your personal information will be kept private, and you won't have to pay any extra costs or receive payment for participating. If you have any questions or concerns, you can contact Dr. Osman or the Institutional Review Board.

Clinical Trial 2: Effects of Seven Day Prucalopride Administration in Healthy Volunteers

Summary 1

This research study aims to explore how prucalopride, a medication, affects people's emotions and brain activity by comparing it to a placebo, which is a substance with no therapeutic effect. Participants will be asked to take this medication as directed and follow specific instructions. The study will involve certain risks, which have been explained to those considering joining. However, it's important to know that joining this study is completely up to you. You can decide not to participate or to leave the study at any time, for any reason, and it won't negatively affect you in any way. This summary is designed to make sure you understand what the study involves and what your options are, empowering you to make the best decision for yourself.

Summary 2

This study, led by Dr. Susannah Murphy, aims to explore how a drug called prucalopride affects the way people process their emotions and brain activity, by comparing it to a placebo (a substance with no therapeutic effect). Participants will be involved for seven days. Joining this study is completely up to you, and you can leave at any time without any negative effects. You'll be asked to follow specific instructions regarding the drug intake. There are some risks involved, which have been explained, but participating could help us understand more about emotional processing. If you decide not to take part, there are other ways to support health research or you can choose not to participate in any study. Your personal information will be kept private, and the results of this study may help improve future treatments. Remember, your safety and privacy are our top priorities, and you're contributing to important research.

Clinical Trial 3: Diagnostic Ultrasound for Measuring Fat of the Body

Summary 1

This research study aims to understand how fat is distributed under the skin across different body parts by using ultrasound imaging and to explore how people feel about their body image. Participants will visit the study site once for about 3 hours, where they will provide some personal information, have photos and ultrasound images taken of various body areas, and complete a questionnaire on body perception. The study seeks to observe differences in fat distribution based on age, gender, and race, which could improve patient education and treatment options. Participation is for one day, although the study will continue for up to 7 months. There are no direct benefits to participants, but the findings could offer valuable insights into skin conditions. Participation is entirely voluntary, and you can withdraw at any time without any negative consequences to your medical care, education, or job. If you choose not to participate or decide to leave the study, it will not affect your rights or benefits.

Summary 2

This study, conducted by Northwestern University's Department of Dermatology, aims to understand human fat thickness under the skin across different body parts using diagnostic ultrasound. It also seeks to connect these measurements with participants' views on their body image. If you choose to participate, you'll visit the study site for about 3 hours in one day. During this visit, you'll provide some personal information, have photos and ultrasound images taken of various body areas, and fill out a questionnaire about your body image. Participation is entirely voluntary, and you can withdraw at any time without penalty. While there are no direct benefits to you, the information gathered could help in understanding and educating about body fat distribution differences among people. The main risk involves the potential identification from photographs. If you decide not to participate, there's no consequence to you, and alternative options will not be affected. Your privacy and the confidentiality of your information are of utmost importance, and measures are in place to protect them.

Clinical Trial 4: Stroke Telemedicine Outpatient Prevention Program for Blood Pressure Reduction (STOP-Stroke)

Summary 1

This research study aims to test if the Stroke Telemedicine Outpatient Program (STOP) can help lower blood pressure in patients who have had a stroke and are at risk of high blood pressure. If you join the STOP group, you'll get an iPad and a special blood pressure monitor to use at home. You'll learn how to use these before leaving the hospital and will fill out some health questionnaires. You'll have video calls with health professionals at certain times after leaving the hospital and get text messages with helpful information every other week. After 6 months, you'll visit the hospital to return the equipment and get \$50. If you're in the usual care group, you'll also fill out health questionnaires and have a follow-up visit, but you'll manage your blood pressure with your regular doctor. Everyone in the study will be checked for up to 6 months. The main risk is that lowering blood pressure too much can cause issues like fainting. If you decide not to join or to leave the study, you can still get care from UTHealth. Participation is completely your choice, and you can stop at any time without affecting your usual care.

Summary 2

This study, called the Stroke Telemedicine Outpatient Program (STOP), aims to see if a special program can help lower blood pressure, make getting care easier, reduce the chance of having another stroke, improve teamwork among health care professionals, and make it easier for patients to get follow-up care after a stroke. If you decide to join, you'll either use a device to check your blood pressure and talk with doctors online, or you'll have a follow-up visit at the hospital. You'll be part of the study for 6 months. There are some risks, like side effects from lowering your blood pressure too much, but we'll be careful to avoid these. Joining is totally up to you, and you can leave the study at any time without affecting your usual care. If you choose not to join, you'll still get a clinic visit and see your regular doctor. Everyone in the study will learn about how to manage blood pressure and will get a special blood pressure check at the end. You won't have to pay extra to be in the study, and you'll get \$50 when you finish. We'll keep your information private, and you can ask questions anytime.

Clinical Trial 5: Effect of a 9-Month Internship Intervention for Military Dependents With ASD

Summary 1

This research study aims to discover effective ways to help individuals with autism spectrum disorder (ASD) find and maintain employment through a program called "Project SEARCH plus ASD Supports" (PS+ASD). Participants will engage in activities such as answering questions, attending the PS+ASD program or high school, taking surveys, and allowing access to their school records over a period of up to 32 months. The main risks include typical workplace or school stress, potential loss of privacy, and discomfort from personal questions, with the option to skip uncomfortable questions or stop participation at any time. Benefits include gaining work experience that could lead to a job, though employment is not guaranteed. The study's findings may also improve job support for people with disabilities in the future. Participation is entirely voluntary, with no penalty for not participating or withdrawing. If you choose not to participate, you will continue your education as usual, and we can discuss other similar programs if interested.

Summary 2

This study aims to discover effective ways to help individuals with Autism Spectrum Disorder (ASD) secure and maintain employment. Participants, who are military dependents aged 18-21 with ASD, will engage in a 9-month internship program or continue their usual high school curriculum. The study will compare these two approaches to identify which is more beneficial in aiding job acquisition. Participation involves completing surveys and allowing access to educational records, with the entire study lasting up to 32 months. There are minimal risks involved, similar to those encountered in everyday school or work environments, such as stress from interactions or potential loss of privacy. Benefits include gaining work experience that could lead to employment. Participation is entirely voluntary, and individuals can withdraw at any time without penalty. If a participant chooses not to partake or withdraws, they will continue their regular education. Alternatives to this study are not participating and seeking out similar work experience programs independently.

Clinical Trial 6: Combining Attention and Metacognitive Training to Improve Goal Directed Behavior in Veterans With TBI

Summary 1

This research study aims to find out if a special training program, called Goal Management Training plus attention training, helps veterans with mild brain injuries improve their planning and organization skills better than a usual treatment. Participants will go through 1 to 23 sessions, starting with a screening that takes 3-4 hours to see if they qualify. If they do, they'll participate in activities, including a grocery shopping test and 20 weekly training sessions lasting 2 hours each, plus some homework. The study will last about 9 months. Participants might feel anxious or tired during some tests, and there's a small chance personal information could be accidentally shared. Benefits include a detailed check of thinking skills, which might help improve treatments for brain injuries. If you're not comfortable, you can leave the study at any time without losing any benefits. If you choose not to join, speech or occupational therapy is available for veterans to help with thinking skills.

Summary 2

This study, led by Dr. Julia Kay Waid-Ebbs at the North Florida/South Georgia Veterans Health System, aims to see if combining Goal Management Training (GMT) with attention training helps veterans with mild traumatic brain injury (TBI) improve their planning and organization skills better than a control treatment. Participants will be involved for about 9 months, attending 1-23 sessions that include a mix of in-person and online activities, such as questionnaires, tests, and training sessions. Some participants may also choose to have an MRI scan. The study might cause some discomfort, like anxiety or frustration, and there are specific risks associated with MRI scans. However, participants might benefit from a better understanding of their thinking skills, which could also help improve treatments for others with TBI in the future. Participation is voluntary, and choosing not to take part won't affect your benefits or rights. If you decide not to participate, individual or group cognitive therapy is available as an alternative. Participants will be compensated for their time, and any injury from the study will be treated by the VA at no cost to the participant. Your privacy will be protected, and information collected will only be shared as required by law.

Clinical Trial 7: DNA Repair Activity in the Skin of Day and Night Shift Workers

Summary 1

This research aims to understand how artificial sunlight, known as UVB, affects the skin of people who work night shifts compared to those who work during the day. If you choose to join, you'll be one of up to 48 participants. You'll need to share your work schedule for the past three months and undergo skin tests in the morning and afternoon. These tests involve taking small skin samples from your lower hip area, which will be examined for changes. The whole process will take about one day, but if stitches are needed, you'll come back in 10-14 days to have them removed. There are some risks, like allergic reactions, small scars, infection, bleeding, or loss of privacy, and there might be other unknown risks. While you might not directly benefit from this study, your participation could help us learn more about how night shift work affects skin response to UVB. Remember, joining is completely your choice, and you can leave the study at any time without losing any benefits you have. If you decide not to participate, that's okay too, and you won't be penalized.

Summary 2

This study aims to understand how the skin of people who work night shifts reacts to artificial sunlight compared to those who work day shifts. Participants will have small skin samples taken from their hip area at two different times in one day to be tested in a lab. The study will take one day, with a possible follow-up visit for those who need stitches removed. There are some risks, like allergic reactions, small scars, infection, or bleeding at the biopsy site. While there may not be direct benefits to those who participate, the information gathered could help others in the future. Joining the study is completely voluntary, and choosing not to participate won't affect your medical care. If you decide not to join, there are no alternative treatments since this is not a treatment study. Participants will be compensated for their time.

Clinical Trial 8: Better Research Interactions for Every Family (BRIEF)

Summary 1

This study aims to improve how parents, especially those from under-represented groups, experience being asked to enroll their infant in a clinical trial focused on a new approach using Darbe plus IV iron. Participants will engage in several activities, including audio-recording consent discussions, completing short online surveys, going through an educational module, and providing feedback through an end-of-study interview. These activities will span the duration of your recruitment efforts for the study. While participating, you might feel uncomfortable discussing your experiences, but you can pause or stop at any time or choose not to answer specific questions. There's a small risk that your personal information could be accidentally shared, but steps will be taken to prevent this. There are no direct benefits to you for participating. Remember, joining this study is completely your choice, and you can leave the study at any time without any negative effects. If you decide not to participate or to stop participating, there won't be any penalty, and you won't lose any benefits you're entitled to.

Summary 2

This study, called Better Research Interactions for Every Family (BRIEF), is looking at ways to make it easier and less stressful for parents to decide if they want their newborns to join a medical study, especially focusing on families from communities that aren't often included in this kind of research. If you choose to join, you'll be part of activities like recording discussions, taking short surveys, going through an educational module, and giving feedback through an interview. This will happen over the same time you're involved in the Darbe Plus IV Iron Study. You won't have to answer any questions you're uncomfortable with, and your participation will end after the feedback interview. While there's no direct benefit to you for taking part, you'll be helping us learn how to better include diverse families in research. Your privacy will be protected, but there's a small chance it could be compromised. Joining is completely up to you, and if you decide not to, or to stop participating, there won't be any negative consequences. If you choose not to join, it won't affect your care. You'll also be compensated for your time if you participate.

Clinical Trial 9: Immersive Virtual Reality Bicycling for Healthy Adults

Summary 1

This study aims to understand how healthy adults feel about biking in different virtual settings. Participants will first share their exercise habits, then try out three biking activities using virtual reality goggles. Each activity lasts 8 minutes, followed by a short survey and a few questions, with the whole visit taking about 1.5 hours. There's a small chance of feeling tired or dizzy, and you might get a bit of redness or discomfort from the goggles, but a health expert will always be there to keep you safe. While helping us create better exercise tools is a benefit, you might not get personal benefits from joining. If you decide not to participate, that's completely okay, and you can also leave the study at any time. Your participation is entirely up to you, and there are no other options if you choose not to join.

Summary 2

This study, led by Dr. Judith Deutsch, aims to understand how healthy adults experience bicycling in various virtual environments. If you're a healthy adult aged 21-75 who can ride a bike, you might be eligible, except if you have certain health conditions like severe heart disease or are unable to follow instructions. Participation involves one visit lasting about 1.5 hours, where you'll try three bicycling activities using virtual reality goggles, followed by surveys and questions. There are minimal risks, such as mild fatigue or discomfort from the goggles, but benefits include contributing to exercise tools development, though direct benefits to you may not be guaranteed. Participation is voluntary, with no cost to you, and you'll be compensated \$25. Your information will be kept confidential to the extent possible. You can withdraw at any time without affecting your rights or benefits. If you decide not to participate, there are no alternatives provided in this study.

Clinical Trial 10: Clinical and Basic Researches Related to ZhenQi Buxue Oral Liquid in Treating Menstrual Disorders

Summary 1

This research is designed to find out which treatment is better for menstrual disorders: Yimaxin (a type of progesterone capsule) or Zhenqi Buxue oral liquid, or a combination of both. We will look at how these treatments improve symptoms and check health indicators over three menstrual cycles, lasting about 3 months. Participants will be divided into three groups, each receiving a different treatment plan. There are no extra risks from joining this study beyond those you might have from treatment alone. If you join, you'll get free exams related to menstrual disorders and the treatments at no cost. Plus, doctors will watch over your health closely and offer advice when needed. Joining this study is completely up to you, and you can leave at any time without it affecting your rights or medical care. If you decide not to join or to stop participating, it won't impact your treatment options.

Summary 2

This study is about testing a traditional Chinese medicine, ZhenQi Buxue Oral Liquid, to see if it helps women with menstrual problems like irregular or missing periods. Participants will be divided into groups to either take this medicine, a hormone pill, or both for three months. They will visit the hospital for checks and share how they're feeling throughout the study. The medicine and all tests are free. This research aims to find a better way to treat menstrual issues without the side effects of current treatments. Joining is completely up to you, and you can leave the study at any time without it affecting your care. If you choose not to join, your doctor will discuss other treatment options with you. Your health and privacy will be carefully protected throughout the study.

Clinical Trial 11: Laparoscopic Versus Open Right Colectomy for Right Colon Cancer

Summary 1

This study aims to find out which surgery method is better for patients with right colon cancer by comparing two types: laparoscopic (a surgery with small cuts) and open right colectomy (a surgery with a larger cut), both following specific surgery principles. Patients will be chosen to join one of the two groups and will be watched closely before, during, and after surgery to see how well they recover and how effective the surgery is at treating their cancer. The study will last from the time you are prepared for surgery until your recovery is fully monitored. The main risks involve possible problems after surgery. However, being part of this study could help improve cancer treatments. Remember, joining this study is completely up to you. If you decide not to participate, it won't affect your care. Your personal information will be kept private, only using a number to identify you in the study results.

Summary 2

This study is about comparing two ways to perform surgery on patients with right colon cancer: one using small incisions with a camera (laparoscopic) and the other with a traditional open surgery. The goal is to see which method is better based on recovery and the quality of cancer removal. If you join, you'll go through some tests and then be randomly chosen for one of the surgeries. After surgery, doctors will watch over you closely. The main risk involves possible complications from the surgery. By being part of this study, you'll help improve how we treat this type of cancer in the future, but your personal details will stay private. This research is expected to last for a specific period, and you should feel free to ask any questions. Remember, joining is completely your choice, and you can leave the study at any time. If you decide not to participate, your doctor will discuss other treatment options with you.
